Consider the Failure Modes under normal use conditions, as well as reasonably foreseeable misuse conditions. For example, if a component is designed to operate in temperature range of 10 – 40 °C, and it has been known that some users have operated it in temperatures of up to 50 °C, then Failure Modes in the 10 – 50 °C should be considered.

In Introduction to Aerospace Materials, 2012. 20.1 Introduction. Fatigue is the most common cause of damage to aircraft structures and engine components. It is estimated that fatigue causes over one-half of all metal component failures, and is responsible for more damage than the combined effects of corrosion, creep, wear, overloading and all the other failure sources on aircraft.

A piping failure is often the first sign of a corrosion problem. Yet in many examples, signs of an impending pipe failure have been evident for months or years, and gone ignored. Failures can be minor (in the form of a pinhole leak) or catastrophic, with significant losses due to water damage as well as the cost of pipe replacement.
